## TRIStar 30 SG INSECTICIDE CONTROL OF SCALE

### Best Practices for Scale Control with TriStar™

- Follow TriStar label rates for both hard and soft scale control (30 SG rates)
- Tank mix with a surfactant to improve coverage for the control of scale.
- Time initial TriStar application at the crawler stage. Crawler results are generally fast.
- Follow with a rotational spray program to include insecticides with other modes of action, like Onyx®, Cygon®, Lorsban®, etc.
- Spray mature adults with TriStar plus a 1-2% Ultrafine Oil tank mix where plant species will tolerate.
- Total population change normally requires a complete season.

Note: Numerous scales and climates have more than one hatch per year. Multiple cycles of treatment may be necessary for season long population control.

***TriStar is the #1 foliar insecticide on the market today.
